To explain:

Three main componants:

- A Host immune response
- **B** Virus evolution
- C Structured host population

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

State of the art

- Different models with different mechanisms
- Qualitative validation

Three main componants:

- A Host immune response
- **B** Virus evolution
- C Structured host population

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● ● ● ● ●

Needs

- Quantitative validation
- Model vs Data via statistical frameworks

Overview of the talk

Tristan da Cunha?

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

Epidemiological context

- 284 islanders in 1971.
- Free of influenza for at least 9 years.
- 1968: emergence of H3N2 influenza.

August 13th, 1971: ship arrival from Cape Town

2 passengers presented influenza symptoms immediately after landing.

A welcome home, *homogeneous mixing*, dance was given!

Epidemiological context

- 284 islanders in 1971.

- 1968: emergence of H3N2 influenza.

August 13th, 1971: ship arrival from Cape Town

2 passengers presented influenza symptoms immediately after landing.

A welcome home, homogeneous mixing, dance was given!

A two waves epidemic

365 attacks for 284 islanders

- 273/284 experienced a first attack (96%).
- 92/284 experienced a second attack (32%).
- Most second attacks coincided with the second wave.

A two waves epidemic

Reporting rate

 Data: daily symptom onset available only for 310/365 attacks (85%)

э.

A two waves epidemic

Objectives of the talk

- Disentangling between different biological hypothesis that could explain this two waves epidemic with multiple infection.
- Model selection based on Maximum Likelihood and AIC.

Contents

Hypothesis and simple influenza models Biological hypothesis for multiple infection Simple influenza models

Parameter inference via Iterated Filtering

Results Model Selection Parameter Estimation

Conclusion

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Multiple infection could be due to:

- Multiple contacts before acquiring long-term immunity.
- Partial immune protection.
- Virus mutation.
- Unless second attacks were not due to flu! (Influenza-like symptoms)

Epidemiological issues:

A better understanding of the host-immune response.

Multiple infection could be due to:

- Multiple contacts before acquiring long-term immunity.
- Partial immune protection.
- Virus mutation.
- Unless second attacks were not due to flu! (Influenza-like symptoms)

Epidemiological issues:

Multiple-contacts model

・ コット (雪) (小田) (コット 日)

Epidemiological status:

- S: Susceptible.
- E : Exposed (latent state).
- I : Infected.
- *R* : short-term Resistance.
- L : Long-term immunity.

Multiple-contacts model

Parameters:

- $\beta = \text{effective contact rate.}$
- 1/e = mean time in state of latent infection.
- 1/v = mean time as Infective.
- 1/g = mean time in Resistant state.
- α = proportion of Resistant developing Long-term immunity.

Multiple-contacts model

$$(1 - \alpha)g$$

$$(1 - \alpha)g$$

$$\beta \in e \cap R \cap Q$$

$$(1 - \alpha)g$$

Erlang distribution for residence time:

$$\mathsf{K} \xrightarrow{k}$$

$$(k_1) \xrightarrow{k/2} (k_2) \xrightarrow{k/2}$$

◆□ > ◆□ > ◆豆 > ◆豆 > ̄豆 = ∽ Q Q @

Partial-immunity model

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Parameter $\sigma \in [0, 1]$

- Partial immunity induced by a previous infection.
- Reinfection treshold $\sigma = 1/R_0$
- Transition between SIR-like and SIS-like dynamics.

Partial-immunity model

Parameter $\sigma \in [0, 1]$

- Partial immunity induced by a previous infection.
- Reinfection treshold $\sigma = 1/R_0$
- Transition between SIR-like and SIS-like dynamics.

Model selection and parameters estimation

Stochastic simulations

- Demographic stochasticity must be taken into account for small population size (stochastic extinction).
- Continuous time Markov process simulated by exact algorithm [Gillespie ,1977]

Model selection

 $AIC_c = -2L(\widehat{\theta}) + 2k + \frac{2k(k+1)}{n-k-1}$ k = number of parameters n = number of observations.

Parameter estimation and 95% I.C. Smoothed profile: $2|L(\theta_{MLE}) - L(\hat{\theta})| < \chi^2_{dl=1}(0.95) = 3.84$

Conclusion

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

We tested 3 biological mechanisms to explain two waves epidemic.

- Multiple-contacts before acquiring long-term immunity appears the most probable.
- Demographic stochasticity between the two waves must be taken into account.
- But maybe the second infection was not due to influenza?

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@
