Viral Dynamics Modelling Drift Computation Application to Viral Infection Analysis Conclusion Perspectives Cellular Transport Intermittent Search Mechanism Early steps of viral infection Scheme Motivations

Cellular Transport

- Extra and Intracellular communication
- Intermittent transport: diffusion and active motion alternation
- Active motion along microtubules (MTs) via molecular motors

Viral Dynamics Modelling Drift Computation Application to Viral Infection Analysis Conclusion Perspectives Cellular Transport Intermittent Search Mechanism Early steps of viral infection Scheme Motivations

Intermittent Search Mechanism

Alternation between diffusion and directed motion to a target

- mRNA granules to synaptic targets along a dendrite.
- DNA-viruses to nuclear pores

Viral Dynamics Modelling Drift Computation Application to Viral Infection Analysis Conclusion Perspectives Cellular Transport Intermittent Search Mechanism Early steps of viral infection Scheme Motivations

Early steps of viral infection

- 1-2: extracellular diffusion and membrane exploring
- 3: Entry
- **3-4**: Intermittent transport: diffusion and directed motion along MTs
- 4: Nuclear delivery of DNA

Figure: G. Seisengerger et al., Science **294**, 1929 (2001).

Limit radius

In cell of radius 50 μ m, positive drift for $d_m \geq 1 \mu m_{\odot}$

Perspectives Asymptotics for structured targets

Escape through a small hole (1)

How long it takes for a brownian particle confined to a domain Ω to escape through a small opening $\partial \Omega_a$ ($\epsilon = \frac{|\partial \Omega_a|}{|\partial \Omega|} \ll 1$)?

Mean escape time

$$\begin{aligned} \tau &= \frac{|\Omega|}{\pi D} ln\left(\frac{1}{\epsilon}\right) \text{ (2-dimensional case),} \\ \tau &= \frac{|\Omega|}{4\epsilon D} \text{ (3-dimensional case),} \end{aligned}$$

 $\mathcal{O} \land \mathcal{O}$

Perspectives Asymptotics for structured targets

Escape through a small hole (2)

Dynkin's system

$$\begin{aligned} \Delta u(\mathbf{x}) &= -\frac{1}{D} \text{ in } \Omega \\ u(\mathbf{x}) &= 0 \text{ on } \partial \Omega_a \\ \frac{\partial u}{\partial n}(\mathbf{x}) &= 0 \text{ on } \partial \Omega_r = \partial \Omega - \partial \Omega_a. \end{aligned}$$

Neumann Function $\mathcal{N}(\mathbf{x},\xi)$

$$\begin{split} &\Delta \mathcal{N}(\mathbf{x},\xi) &= -\delta(\mathbf{x}-\xi) \text{ for } \mathbf{x},\xi \in \Omega \\ &\frac{\partial \mathcal{N}}{\partial n}(\mathbf{x},\xi) &= -\frac{1}{|\partial \Omega|} \text{ for } \mathbf{x} \in \partial \Omega, \xi \in \Omega. \end{split}$$

Quantifying Intermittent Transport in Cell Cytoplasm

Escape through a small hole (3)

$$\int_{\Omega} \mathcal{N}(\mathbf{x},\xi) \Delta u(\mathbf{x}) - \Delta \mathcal{N}(\mathbf{x},\xi) u(\mathbf{x}) d\mathbf{x} = \int_{\partial \Omega_a} \mathcal{N}(\mathbf{x},\xi) \frac{\partial u}{\partial n}(\mathbf{x}) d\mathbf{x} + \frac{1}{|\partial \Omega|} \int_{\partial \Omega} u(\mathbf{x}) d\mathbf{x}$$

and

$$\int_{\Omega} \mathcal{N}(\mathbf{x},\xi) \Delta u(\mathbf{x}) - \Delta \mathcal{N}(\mathbf{x},\xi) u(\mathbf{x}) d\mathbf{x} = u(\xi) - \frac{1}{D} \int_{\Omega} \mathcal{N}(\mathbf{x},\xi) d\mathbf{x}$$

thus

$$u(\xi) - \frac{1}{D} \int_{\Omega} \mathcal{N}(\mathbf{x},\xi) d\mathbf{x} = \int_{\partial \Omega_a} \mathcal{N}(\mathbf{x},\xi) \frac{\partial u}{\partial n}(\mathbf{x}) d\mathbf{x} + \frac{1}{|\partial \Omega|} \int_{\partial \Omega} u(\mathbf{x}) d\mathbf{x}$$

Escape through a small hole (4)

For $\xi \in \partial \Omega_a$, C_0 the constant leading order in ϵ of $u(\mathbf{x})$ and $g(s) = \frac{g_0}{\sqrt{\epsilon^2 - s^2}}$ the local expansion of $\frac{\partial u}{\partial n}$ on the boundary:

$$-rac{1}{D}\int_{\Omega}\mathcal{N}(\mathbf{x},\xi)d\mathbf{x}=\int_{\partial\Omega_{a}}\mathcal{N}(s)g(s)ds+C_{0}$$

 $\mathcal{N}(s) = \frac{1}{4\pi|s|} + \text{ regular function}, -\frac{1}{D} \int_{\Omega} \mathcal{N}(\mathbf{x}, \xi) d\mathbf{x}$ is bounded and $g_0 = \frac{|\Omega|}{2\pi\epsilon D}$ (compatibility condition). Thus:

$$u(\mathbf{x}) \approx C_0 = \frac{|\Omega|}{4\epsilon D}$$
